JavaScript and JSON

In this lab, you'll extract data from a provided JSON structure and use that data to modify the contents of an HTML page.

Actually, you'll use pretty much **the same page** as you used in the *JavaScript/DOM lab*; same buttons, event handlers, yah de yah. The difference is that you'll not create/append HTML elements using the DOM. Rather, you'll **create strings of HTML elements containing data from a provided JSON onject.**

The page outputs are the same as that for the DOM lab; no need to repeat it here.

Use the starter code in **JSONExercise.html**, which shows how to generate some HTML element strings for some of the options.
